

ONLINE FOOD DELIVERY ANALYSIS

Project Documentation & Portfolio Summary

Project Overview

This comprehensive analysis examines online food delivery patterns to uncover critical insights into customer behavior, restaurant efficiency, and revenue trends. By leveraging Python for data preparation and Power BI for interactive visualization, the project delivers actionable intelligence for stakeholders in the food-tech industry.

Total Orders Analyzed
2,000+

Total Revenue Generated
₹ 2.05 Million

Dashboard Visualization & Features

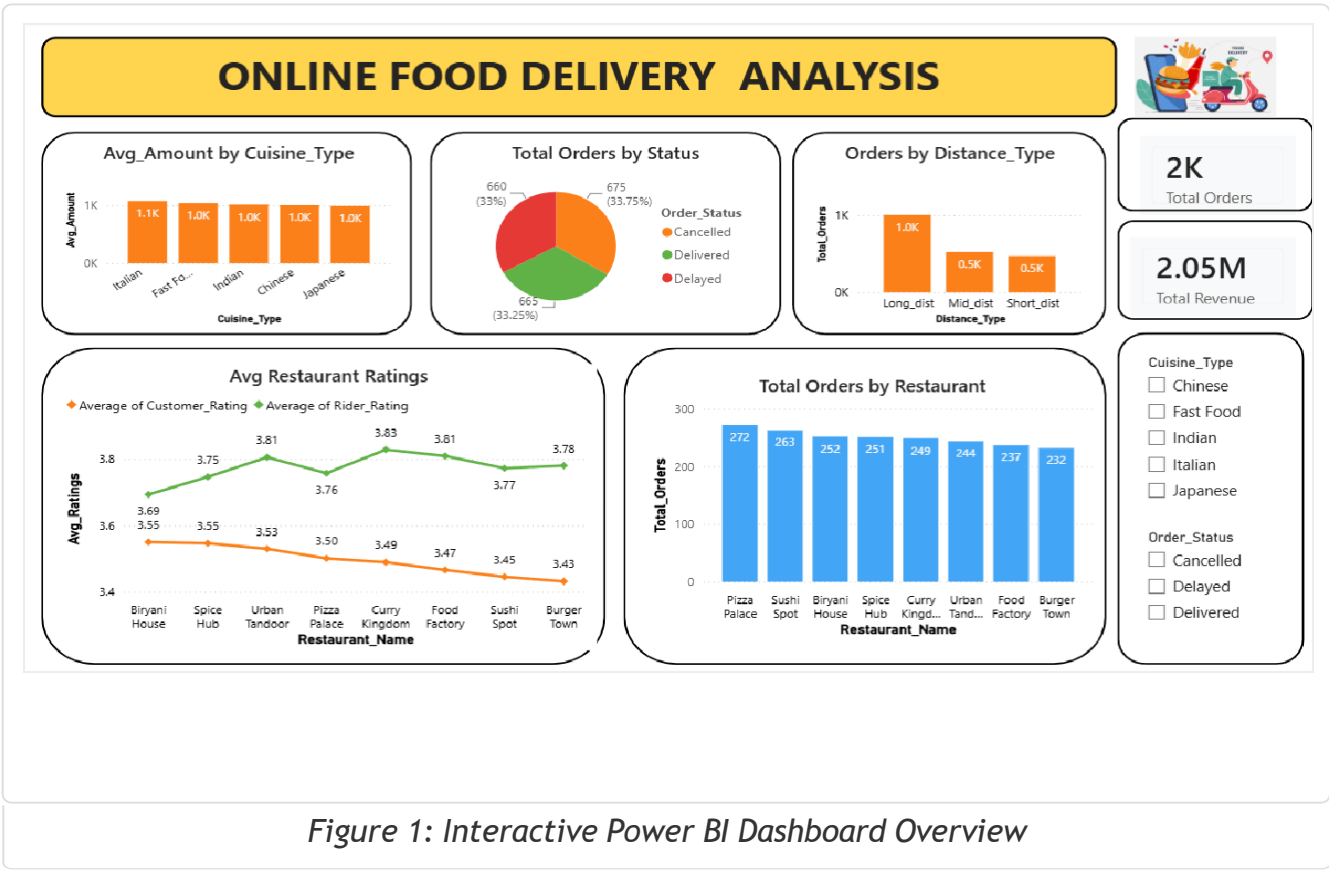

Figure 1: Interactive Power BI Dashboard Overview

- **Order Status Analysis:** Real-time tracking of Delivered, Delayed, and Cancelled orders to monitor operational health.
- **Restaurant Performance:** Ranking of top restaurants (e.g., Pizza Palace, Sushi Spot) by order volume.
- **Distance Analysis:** Segmentation of orders by delivery distance (Long, Mid, Short) to understand logistical load.
- **Cuisine Trends:** Breakdown of popularity and average order value across Italian, Indian, Fast Food, etc.

Key Insights & Data Analytics

- **Delivery Efficiency:** While 33% of orders are delivered successfully, a significant portion faces delays or cancellations, highlighting logistical optimization needs.
- **Logistics:** Long-distance deliveries account for the highest order volume, suggesting a willingness in customers to pay for premium or specific long-range options.
- **Sentiment Analysis:** Rider ratings consistently outperform customer ratings, indicating high satisfaction with personnel but potential room for improvement in overall order/food quality.
- **Market Leaders:** *Pizza Palace* and *Sushi Spot* dominate the volume charts, making them key anchors for the delivery platform.
- **Spending Patterns:** Italian cuisine commands the highest average order amount (1.1K), followed closely by Fast Food and Indian.

Technical Implementation

Dataset Structure: The analysis was performed on a dataset containing 2000 records with features such as:

Feature Category	Attributes Included
Temporal	Order Date, Delivery Time
Geographic	Distance Category, Restaurant Location
Financial	Order Amount, Revenue
Qualitative	Customer Rating, Rider Rating, Cuisine Type

Stack: Python (Pandas/NumPy) for ETL, Power BI + DAX for calculated measures and interactive UI design.
